Random Numbers in NumPy

Generate Random Number

```
from numpy import random

x = random.randint(100)

print(x)
```

```
85
```

Generate Random Float

```
from numpy import random

x = random.rand()

print(x)
```

```
0.6831311271271019
```

Generate Random Array

```
from numpy import random

x=random.randint(100, size=(5))

print(x)
```

```
[81 59 32 57 38]
```

Generate a 2-D array with 3 rows, each row containing 5 random integers from 0 to 100:

```
from numpy import random
```

```
x = random.randint(100, size=(3, 5))

print(x)
```

```
[[95 59  6 63 93]
 [87 57 82 82 97]
 [66 59 87 44 67]]
```

Generate a 1-D array containing 5 random floats:

```
from numpy import random

x = random.rand(5)

print(x)
```

```
[0.75524829 0.93789731 0.69863052 0.64924527 0.29033769]
```

Generate a 2-D array with 3 rows, each row containing 5 random numbers:

```
from numpy import random

x = random.rand(3, 5)

print(x)
```

```
[[0.20129905 0.47238605 0.6318531  0.26624856 0.35885055]
 [0.6989133  0.91153665 0.83253698 0.063914   0.17620655]
 [0.06237514 0.03084821 0.09379478 0.77239583 0.15939603]]
```

Generate Random Number From Array

```
from numpy import random

x = random.choice([3, 5, 7, 9])

print(x)
```

```
9
```

Generate a 2-D array that consists of the values in the array parameter (3, 5, 7, and 9):

```
from numpy import random

x = random.choice([3, 5, 7, 9], size=(3, 5))

print(x)
```

```
[[5 7 7 9 9]
 [9 3 3 5 5]
 [5 5 5 7 3]]
```
