Machine Learning - Standard Deviation

Use the NumPy std() method to find the standard deviation:

```
import numpy

speed = [86,87,88,86,87,85,86]

x = numpy.std(speed)

print(x)
```

```
0.9035079029052513
```

Example

```
import numpy

speed = [32,111,138,28,59,77,97]

x = numpy.std(speed)

print(x)
```

```
37.84501153334721
```

Use the NumPy var() method to find the variance:

```
import numpy

speed = [32,111,138,28,59,77,97]

x = numpy.var(speed)

print(x)
```

```
1432.2448979591834
```

Use the NumPy std() method to find the standard deviation:

```
import numpy

speed = [32,111,138,28,59,77,97]

x = numpy.std(speed)

print(x)
```

```
37.84501153334721
```
